CalderaRIP
Version 17

CALDERA

What's new in Version 17

Powered by Adobe PDF Print Engine 6.2

Version 17 integrates the newest version of Adobe PDF Print Engine to ensure optimal performance and accuracy when rendering all your design files.
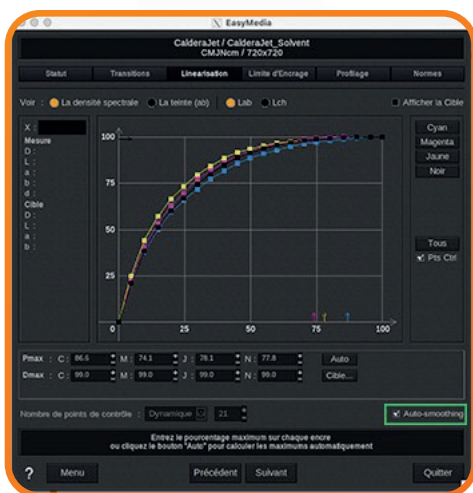

Cut around bleed

When producing Canvas, use the new Cut around bleed feature to automatically generate a cut contour around the bleed of the canvas.

Duplicate hotfolders

Duplicate existing hotfolders and configure them to create variations of your workflows in no time— and enhance automation possibilities.

Master your colors

Linearization Auto-smoothing

Enable the auto-smoothing option in EasyMedia to improve the linearization curve and eliminate color measurement inaccuracies.

Pantone Formula Guide

Access the latest PANTONE Solid Coated V5 and Solid Uncoated V5 colors directly in CalderaRIP to match precise colors in your daily operations.

ΔE DeltaE formula selection

Choose the formula to measure the distance between colors in EasyMedia— and achieve more accurate colors for all types of substrates.

CalderaCare

## Reduce ink consumption by up to 35%

No need to redo your ICC profiles to save on ink! Once enabled, InkPerformer automatically calculates a new color combination to decrease the amount of ink printed on the substrate— without compromising color accuracy.

NEW IN V17— One InkPerformer license for one printer is now included in CalderaCare.

Caldera REST API

The new REST API facilitates the integration of CalderaRIP with third-party applications. Connect your RIP to your web shop or ERP to enable a more efficient workflow, and open the way for automatic job submission, job spooling and job cost tracking.

SmartImport

Extract metadata from the filename (copies, printer, presets, height, width, scale) to automate job submission.

NEW IN V17— Use the "repeat_y" metadata to set the desired number of vertical pattern repetition for textile printing workflows.

QuickPrint auto-naming

Save time exporting & sharing your presets between your printers! When exporting a print configuration, CalderaRIP automatically renames it with relevant information (Export_Printer_Preset_Date).

Bicubic resampling

When rescaling an image, enable the bicubic resampling option to generate sharper details. The bicubic resampling method avoids pixelated effects.

PrintProof

Export TIFF proofs of your jobs after ripping and send them to your customers to avoid unwanted waste.

New OS Support & Drivers

macOS Sonoma
